

evstations preventative maintenance program

Commercial EV charging stations serve businesses, municipalities, institutions and multi dwelling communities.

Dependability is crucial for fleet users, company employees, business customers and residents who rely upon charging station access.

MPOWER's **Preventative Maintenance Program (PMP)** helps commercial clients sustain optimum service levels for their user populations.

PMPs are personally tailored to meet the individual needs of commercial clients. Inspection checklists cover the touch points of installed stations by equipment style.

Urgent issues are reported immediately to site contacts. If signs of damage to the charging cables and/or connectors is found, the station is turned off and site contacts are notified to keep it off.

MPOWER certified techs use tablets on site for real time reporting. All conditions found, and service advisories if needed, are emailed to the client's designated contacts.

PMP clients can access their complete service history and procedure data at any time by request. MPOWER also provides 24/7 service access in the event of equipment malfunction or severe weather damage.
